MODEL SZD251CDA HEAVY DUTY CHAIN DRIVEN ZERO PRESSURE ACCUMULATOR

DRIVE OPERATED ZONES

Conveyor shown with optional supports

SZD251CDA SMART ZONE® is a heavy duty roll-to-roll chain driven zero pressure accumulator, designed to safely accumulate heavy products such as castings, drums, containers and heavy pallet loads in 5' zones. The Roach design incorporates photo electric sensors--instead of sensor rollers--which eliminates many of the problems associated with conveying wooden pallets. Products do not touch during accumulation and are singulated individually off of conveyor. SMART ZONE® is easy to install and simple to maintain.

ELECTRICAL CONTROLS

CUSTOM DESIGNED ELECTRICAL SYSTEMS/COMPONENT CONTROLS

Roach custom-designed and engineered control panels may be ordered to Underwriters Laboratories UL₅₀₈ approval. Above electrical panel is painted optional Roach blue.

Roach Continuous Vertical Conveyors (model CVC) are manufactured with controls specifically designed to meet the needs of your specialized application. Notice the controls panel mounted on the side of the above conveyors at the lower feed level. Shown below are some of the sample COMPONENT controls used on various conveyors when turnkey system controls are not required. Components such as manual starters, magnetics starters, push button stations, etc., may be utilized to perform more simplistic operator functions. NOTE: When quoting and purchasing COMPONENT controls, electrical controls must be selected based on the operation and by adhering to ALL local & national electrical codes.

GENERAL

Roach offers custom designed electrical controls as an integral feature of turnkey SYSTEMS capabilities. We locate photo cells, limit switches, operator interface terminals (OIT), push button stations, run conduit and make field connections- whatever it takes to put control in the hands of your system operators.

Most frequently controls packages contain Allen Bradley brand controls, our standard control components. However, occasionally it is necessary to use other brands to facilitate customer requests.

Consult Roach to learn how our team of electrical engineers can design, install and implement a custom electrical systems package--placing your systems operators in TOTAL control.

GRAVITY CONVEYORS

FLEXIBLE CONVEYOR

TECHNICAL MISCELLANEOUS GRAVITY

ROLLER CENTER SPACING

In order to convey your product smoothly and efficiently, it must be supported by a minimum of three rollers. To compute the center to center roller spacing required, divide the length of your package by 3. The dividend is your required spacing. For example, a package 24" long, divided by 3, yields a dividend of 8". Therefore, the required spacing would be 8" center to center. Flexible bottom packages require four or more supporting rollers per package.

Grades recommended here are not exact and should be used only to estimate your requirements. Figures at left are intended for average conditions, using proper size rollers for materials handled. Additional grade may be required in some cases.

Starting a package from rest on level lines requires a push of approximately 3% of the total load. For heavy loads a pitch of 1/8" per foot will reduce push required.

The amount of drop required for 90° curves with 4' inside radius is approximately the same as required per 10' section.

WHEEL SPACING

Products to be conveyed on wheel conveyor should have a smooth and firm bottom to maximize conveyability. It is important to note that wheel conveyor should have a minimum of 5 wheels under smallest box size and a minimum of 3 axles under it at all times.

TECHNICAL LINE SHAFT HORSEPOWER DATA

GENERAL

Since many sections and accessories may be coupled to one drive, it is important that the motor be properly sized for each application.

Table I (at right) may be used as a general guide to selection of drive motor sizes for typical installations.

When powered accessories are added to straight sections, the maximum allowable length must be adjusted. Table II (below) lists the horsepower required for the various accessories.

Factors that are important to power requirements include the number of rollers per foot, the total length of straight sections, the number and type of powered accessories and the desired speed of the conveyor.

NOTE: Drive cannot be located more than 75' from either end on 3" RC; 90' from either end on 4" RC; or 100' from either end on 6" RC.

796LS CAPACITY

The drive capacity accepted is 15 lbs. per roller. The type of package and/or material being conveyed may increase or decrease this capacity. Very hard, rigid, flat bottom containers increase roller capacity while soft, uneven surfaces will decrease it.

NOTE: Drive capacity for model 738LS is 10 lbs. per roller; 7.5 lbs. roller capacity for model 738LSC.

ROLLER CENTERS

The number of rollers required per package is dependent upon package weight, package length, drive capacity per roller, and type of surface. The package formulas (at right) should be used to determine the maximum allowable roller centers. Use the lesser of the two values rounded to the nearest standard roller centers. Finally, only use model 738LS for light duty applications where close roller centers are required.

ROLLER LENGTH

DETERMINING ROLLER LENGTH

The best method for ordering additional or replacement rollers is to always specify the between frames dimension (BF). This will ensure a proper fit for rollers and conveyor frames. If the end-user does not know what the BF dimension is, simply have this person measure between the frames of the specified unit. However, there are times when getting a between frames dimension is difficult. In this instance, it is very important to use the proper terminology to select a roller size. The only dimension acceptable in determining roller length when the BF is not known, is the "end-of-bearing" measurement. The importance here cannot be overstated. Since conveyor/roller manu-

facturers vary the length of the roller tube in relation to the manner in which the bearing is inserted-and depending on the individual bearing being used-countless dimensions are possible. For example, one manufacturer may use an 18-1/2" long tube in production of its 19" BF roller. Another may be using a different

bearing or possibly a different method of installing the bearing and cut its tube to a length of 18-1/4". This 1/4" difference is enough--believe it or not--to be the culprit of serious problems--at exactly the time the end-user receives a shipment of non-returnable rollers the wrong length! See illustration above.

TECHNICAL CURVES AND SPURS

GENERAL

STRAIGHT FACE ROLLERS are recommended where packages of uniform size are conveyed and rubbing against guards is not objectionable.

DIFFERENTIAL ROLLERS offer reduced package swerve. Package travels more easily. Guard rails should be used.

TAPERED ROLLERS are recommended above all others because of their improved carrying surface. They hold the package in relatively the same position through the entire curve.

NOTE: Orientation of product may be affected because of straight rollers in curve. If orientation of product must be maintained, a tapered roller curve should be used. Consult factory.

48"	-	-	-	-	-	-	33	37	41
52"	-	-	-	-	-	-	34	38	42

To determine width needed, use formula shown below, or convenient table at left.

CURVE WIDTH FORMULA
 + (Inside Radius + Package Width)²
 + (Package Length ÷ 2)²
 = Subtotal
 √ Subtotal
 - Inside Radius
 + 2"
 = Width in Curve (BF)

NOTE: Length of package must not exceed length of inside radius.

DETERMINING HAND OF SPUR

When placing an order for any spur, hand of spur must be determined and specified. The drawing at right illustrates both left hand and right hand spurs. It is acceptable to converge at either 30° or 45°. However, on diverging spurs, it is most desirable to divert at 30°.

TECHNICAL WHEEL CONVEYORS AND PATTERNS

GENERAL

Gravity wheel conveyors are best suited for light duty applications. The key criteria is that the load bottom surface is flat, rigid and smooth. Soft bottom packages are not recommended since wheels may indent soft bottom containers,

thus curtailing product movement. Also, consideration must be given to the construction of the bottom surface of the product container. A wooden crate, for example, may hang on individual wheels and not start from its stopped position.

When calculating minimum wheel spacing required, the wheel patterns below may be used to determine minimum wheel spacing. Wheel axles are spaced on 3" centers.
